

Cereal Nutrition Data Analysis

By: Eaint Sandi

Date: 9.5.2026

This project analyzes cereal nutrition data to understand how nutritional factors such as sugar and fiber influence cereal ratings. The analysis is completed by using Microsoft Excel with scatter plots, pivot tables and dashboard visualizations.

This dataset contains information about cereal products including manufacturer, calories, sugar, fiber, protein and customer ratings. These variables were used to define the relationships between nutrition and cereal quality.

The dataset was checked for duplicates and invalid values. Negative values in nutrition columns were assumed as incorrect data and removed from cleaning.

Figure 1 : Sugar vs Rating(Avg) Scatter Plot

The scatter plot shows a negative relationship between sugar and average rating. Cereals with higher sugar content generally received lower ratings.

Figure 2 : Fiber vs Rating(Avg) Scatter Plot

The Fiber Vs Rating scatter plot indicates that cereals with higher fiber content tend to receive higher ratings.

Row Labels	Average of rating
High Sugar	30.65162295
Low Sugar	47.10448745
Grand Total	42.55830121

The pivot confirms that low-sugar cereals have a higher average rating compared to high-sugar cereals.

The analysis suggests that nutritional quality strongly affects cereal ratings. Lower sugar and higher fiber cereals consistently performed better in both detailed summarized visualizations.
